IBM BigFix® can help you achieve smarter, faster endpoint management and security. You can see and manage physical and virtual endpoints, rapidly remediate issues, maintain compliance, and report on endpoints in near real time.

What you'll learn: This two-day Proof of Concept will cover the following BigFix technologies*:

IBM BigFix Lifecycle Management provides real-time visibility into the state of endpoints, giving administrators advanced functionality for managing OS deployment and migrations, software installations and updates, and remote administration. Lifecycle Management includes the following capabilities:

- **Patch Management:** Allows you to assess, deploy and manage patches for operating systems and applications throughout heterogeneous environments.
- **Software Distribution:** Provides the ability to distribute software and updates to endpoints throughout the enterprise, from one location, and maintain visibility throughout the deployment.
- **Operating System Deployment:** Enables IT staffs to create and deploy bare-metal OS images to workstations and servers, reimage managed endpoints, and automate post-image processes
- **Server Automation:** Enables users to perform advanced application deployment throughout servers, including task sequencing—without the need for programming skills.

IBM BigFix Compliance provides unified, near real-time visibility and enforcement of patches, configuration baselines and multiple third-party anti-malware systems. Compliance provides an analytics dashboard to view and maintain compliance and vulnerability posture over time.

IBM BigFix Inventory provides software license compliance data. Inventory identifies licensed and unlicensed software with in-depth granularity. It tracks software usage patterns and trends to support better planning, budgeting and vendor license compliance

IBM BigFix Platform is a flexible enterprise management system that gives security and operations visibility into the same information, allowing them to make informed decisions and take appropriate actions to keep the enterprise safe from vulnerabilities. The BigFix Platform contains the following components:

- **BigFix Web User Interface:** Provide a summarized, one-page view of the IT infrastructure for executives and security professionals. Query the enterprise for the existence of zero-day vulnerabilities, and conditions that may lead to compromise. Give administrators the tools they need to take action on identified vulnerabilities, and monitor the overall compliance posture of the enterprise.

- **BigFix Web Reporting:** Allow authorized users to connect through a web browser to view all the information about computers, vulnerabilities, actions, and more.
- **Fixlet Relevance:** The “brain” of the Fixlet message that allows Fixlet messages to target only computers with specific characteristics that indicate it has a problem.

Cost: This session is offered free of charge. Complimentary refreshments including continental breakfast and lunch will be provided. However, participants are responsible for their own business travel expenses.

Who Should Attend? This class is designed for IT administrators and security professionals who are responsible for maintaining assets, providing security, keeping software current, and performing other operations and security-related tasks within an organization.
